

# Self-Hosting

Last Modified on 12.12.2023

## What is self-hosting?

Self-hosting is a significantly reduced frontend-only setup of Userlane, that does not support any feature that relies on the cloud.

## When is it the right choice?

Userlane always recommends the Cloud Version of Userlane that comes with highest security standards on the Microsoft Azure Cloud and Enterprise-grade support options. The self-hosting is offered to support customers with a security policy that prevents them from working with the Microsoft Azure Cloud, and in areas where the full functionality set is not required.

## Capability comparison /limitations

Please review the limitations [here](#).

## How does self-hosting work?

## How do I set self-hosting up?

Follow the steps [here](#).
